Plant Identification

For something seriously rewarding on Saturday mornings, think about OH 77, Spring and Summer Plant ID this Spring semester.

Learn to identify 150 of the most common and useful landscape plants of the San Francisco Bay Area.

This course is oriented to the person either working or seeking professional involvement in horticulture, but is also of interest to home gardeners, and to those who simply want to know more about their natural environment.

The class covers the identifying characteristics, common and botanical names and cultural requirements of the plants and includes the basics of plant anatomy as it relates to taxonomy and identification. About half of the class meetings take place at Strybing Arboretum in Golden Gate Park.

OH 77 satisfies one of the core requirements for all Certificates and Degrees in Environmental Horticulture.

OH 77 (CRN# 34101) will meet in the Horticulture Center, Phelan Campus, starting January 20. The classes start at 9 a.m. If you have any questions about the course or problems with registration, please contact the instructor, Malcolm Hillan, at 452-5655 or at jmhillan@ccsf.edu.
